APPROVED JURISDICTIONAL DETERMINATION FORM **U.S. Army Corps of Engineers**

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD): 18 October 2021 A.

B. **DISTRICT OFFICE, FILE NAME, AND NUMBER: SWT-2021-00559**

C. PROJECT LOCATION AND BACKGROUND INFORMATION:

State: Oklahoma County/parish/borough: Rogers City: Verdigris Center coordinates of site (lat/long in degree decimal format): Lat. 36.2730° N, Long. -95.65.16° W. Universal Transverse Mercator:

Name of nearest waterbody: Mossy Creek

Name of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: Verdigris River

Name of watershed or Hydrologic Unit Code (HUC): 110701050205

Check if map/diagram of review area and/or potential jurisdictional areas is/are available upon request.

Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY):

Office (Desk) Determination. Date: 1 October 2021

Field Determination. Date(s):

SECTION II: SUMMARY OF FINDINGS A. RHA SECTION 10 DETERMINATION OF JURISDICTION.

There Are no "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area. [Required]

Waters subject to the ebb and flow of the tide.

Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce. Explain:

B. CWA SECTION 404 DETERMINATION OF JURISDICTION.

There are and are not "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area. [Required]

1. Waters of the U.S.

- a. Indicate presence of waters of U.S. in review area (check all that apply): ¹
 - TNWs, including territorial seas
 - Wetlands adjacent to TNWs
 - Relatively permanent waters² (RPWs) that flow directly or indirectly into TNWs
 - Non-RPWs that flow directly or indirectly into TNWs
 - Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
 - Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
 - Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
 - Impoundments of jurisdictional waters
 - Isolated (interstate or intrastate) waters, including isolated wetlands
- b. Identify (estimate) size of waters of the U.S. in the review area: Non-wetland waters: 1,191 linear feet: 5-8 width (ft) and/or 0.2 acres. Wetlands: 2.98 acres.
- c. Limits (boundaries) of jurisdiction based on: Established by OHWM. Elevation of established OHWM (if known):
- Non-regulated waters/wetlands (check if applicable):³ 2.
 - Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined to be not jurisdictional. Explain: Three isolated wetlands were identified within the review area. The three features lack a surface or subsurface connection to jurisdictional waters of the U.S. The three, isolated features lack an ecological connection to iurisdictional waters.

¹ Boxes checked below shall be supported by completing the appropriate sections in Section III below.

² For purposes of this form, an RPW is defined as a tributary that is not a TNW and that typically flows year-round or has continuous flow at least "seasonally" (e.g., typically 3 months).

Supporting documentation is presented in Section III.F.

SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW:

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent":

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY):

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under *Rapanos* have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are "relatively permanent waters" (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary with perennial flow, skip to Section III.D.4.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody⁴ is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

 (i) General Area Conditions: Watershed size: 36.24 square miles Drainage area: 250 acres Average annual rainfall: 43.45 inches Average annual snowfall: 8.8 inches

(ii) Physical Characteristics:

(a) <u>Relationship with TNW:</u>

 ☐ Tributary flows directly into TNW.
 ☑ Tributary flows through 2 tributaries before entering TNW.

Project waters are 5-10 river miles from TNW.
Project waters are Project waters are Project waters are 1 (or less) river miles from RPW.
Project waters are 1 (or less) aerial (straight) miles from RPW.
Project waters cross or serve as state boundaries. Explain: N/A.

Identify flow route to TNW⁵: The unnamed tributary of Mossy Creek flows into Mossy Creek which flows into the Verdigris River, a Traditionally Navigable Water.

⁴ Note that the Instructional Guidebook contains additional information regarding swales, ditches, washes, and erosional features generally and in the arid West.

⁵ Flow route can be described by identifying, e.g., tributary a, which flows through the review area, to flow into tributary b, which then flows into TNW.

Tributary stream order, if known: The unnamed tributary of Mossy Creek is a first order stream.

(b)	General Tributary	Characteristics (check all that apply	<u>y):</u>				
	Tributary is:	🔀 Natural					
		Artificial (man-made). Explai					
		Manipulated (man-altered). E	Explai	n: .			
	:						
	Primary tributary Silts Cobbles Bedrock Other. Ex			y): Concrete Muck r: Herbaceaous 10-15%			
	Tributary condition/stability [e.g., highly eroding, sloughing banks]. Explain: The banks of the unnamed tributary are raight and stable. The banks are low with vertical slope. Presence of run/riffle/pool complexes. Explain: Run/riffle/pool complexes were not observed within the unnamed						
tributary.	Tributary geometry: Relatively straight Tributary gradient (approximate average slope): 1-3 %						
	 (c) <u>Flow:</u> Tributary provides for: Seasonal flow Estimate average number of flow events in review area/year: 11-20 Describe flow regime: The unnamed tributary exhibits intermittent, seasonal stream flow. This is likely influenced cipitation and supplemented by stormwater runoff from neighboring residential and commercial development. Other information on duration and volume: . 						
and forested w				confined to the stream channel and is influenced by emergent he wetlands to the confined stream channel.			
	Subsurface flow: Unknown. Explain findings: Dye (or other) test performed: .						
	 ☑ Bed and I ☑ OHWM⁶ □ clear ☑ chang ☑ shelv □ leaf I □ sedin □ water □ other 	(check all indicators that apply): , natural line impressed on the bank ges in the character of soil		the presence of litter and debris destruction of terrestrial vegetation the presence of wrack line sediment sorting scour multiple observed or predicted flow events abrupt change in plant community			
	High Tid oil or fine s physic tidal	an the OHWM were used to determine de Line indicated by:	Mean s	eral extent of CWA jurisdiction (check all that apply): n High Water Mark indicated by: urvey to available datum; hysical markings; egetation lines/changes in vegetation types.			

(iii) Chemical Characteristics:

⁶A natural or man-made discontinuity in the OHWM does not necessarily sever jurisdiction (e.g., where the stream temporarily flows underground, or where the OHWM has been removed by development or agricultural practices). Where there is a break in the OHWM that is unrelated to the waterbody's flow regime (e.g., flow over a rock outcrop or through a culvert), the agencies will look for indicators of flow above and below the break. ⁷Ibid.

Characterize tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc.). Explain: The RPW is located in a densely vegetated area, downstream of a linear emergent wetland, forested wetland, and impoundment. The acquatic resources provide sediment filtering and allow nutrient recycling to occur. Identify specific pollutants, if known: Unknown.

(iv) Biological Characteristics. Channel supports (check all that apply):

Riparian corridor. Characteristics (type, average width): Approximately 30 feet in width extending from the RPW to project boundary consisting of dense herbaceous vegetation and woody plant species.

- Wetland fringe. Characteristics:
- Habitat for:
 - Federally Listed species. Explain findings:
 - Fish/spawn areas. Explain findings:
 - Other environmentally-sensitive species. Explain findings:

Aquatic/wildlife diversity. Explain findings: Frogs, crayfish, and other macro invertebrates likely inhabit the RPW.

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

- (a) General Wetland Characteristics:
 - Properties:

Wetland size: 2.98 acres

Wetland type. Explain: The review area contains an emergent and forested wetland complex to include PEM1-2, PEM1-3, PEM1-4, and PFO1-1. The wetland complex exhibited hydric soils, hydrophytic vegetation, and hydrology and is located directly abutting the intermittent stream channel on site. PEM1-1 was delineated collectively to include two, non-jurisdictional, circular wetlands along the western property boundary and one linear emergent wetland in the central portion of the project area that conveys stormwater run off from adjacent grassland pasture. The linear wetland exhibits wetland vegetation, soils and hydrology and is adjacent to the jurisdictional, unnamed tributary of Mossy Creek, a RPW.

Wetland quality. Explain: Due to the site being used for cattle grazing and the surrounding agricultural, commercial, and residential developments, the existing wetlands have been determined to be impacted.

Project wetlands cross or serve as state boundaries. Explain: N/A.

(b) General Flow Relationship with Non-TNW:

Flow is: **Ephemeral flow**. Explain: The linear portion of PEM1-1 could be considered an ephemeral drainage, but due to the presence of hydric soils, vegetation, and hydrology, the feature is considered a wetland. During rain events, the linear feature identified within PEM1-1 may convey overland flow to the unnamed tributary of Mossy Creek, a RPW. Overland sheet flow from the surrounding properties contribute flow through the wetlands and into the stream. PEM1-2, PEM1-3, PEM1-4, and PFO1-1 likely contribute intermittent flow to the RPW located downstream within the review area.

Surface flow is: **Discrete and confined** Characteristics: .

Subsurface flow: Unknown. Explain findings:

- (c) Wetland Adjacency Determination with Non-TNW:
 - Directly abutting

Not directly abutting

Discrete wetland hydrologic connection. Explain: PEM1-2, PEM1-3, PEM1-4, and PFO1-1 contribute a direct hydrologic connection to RPW1-1 located within the review area, downstream of the wetland complex.

Ecological connection. Explain: The linear feature identified as a portion of PEM1-1 in the center of the project area is located in close proximity to the RPW. PEM1-2, PEM1-3, PEM1-4, and PFO1-1 are part of a continuous wetland complex, with hydrologic flow direction from the northeast to the southeast, towards and into the intermittent stream located on the eastern edge of the property.

Separated by berm/barrier. Explain:

(d) <u>Proximity (Relationship) to TNW</u>

Project wetlands are **5-10** river miles from TNW. Project waters are **2-5** aerial (straight) miles from TNW. Flow is from: **Wetland to navigable waters.** Estimate approximate location of wetland as within the **500-year or greater** floodplain.

(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics; etc.). Explain: The wetland complex was found to contain water at the time of the field investigation. Identify specific pollutants, if known: Unknown.

(iii) Biological Characteristics. Wetland supports (check all that apply):

Riparian buffer. Characteristics (type, average width):

Vegetation type/percent cover. Explain: The emergent wetlands consist of spikes, rushes, smartweed, and sedges

providing approximately 80-90% cover at the time the delineation was completed. PFO1-1 consists of the same herbaceous plants to

include the presence of green ash, black willow, and sugarberry woody vegetation providing approximately 70% surface cover to the forested wetland.

- Habitat for:
 - Federally Listed species. Explain findings:
 - Fish/spawn areas. Explain findings:

I risk spawn areas Explain memory.
 Other environmentally-sensitive species. Explain findings:
 Aquatic/wildlife diversity. Explain findings: The wetlands within the review area likely serve as wildlife habitat.

Frogs, crayfish, and other macro invertebrates likely inhabit the wetland complex.

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in the cumulative analysis: 5 Approximately (3.04) acres in total are being considered in the cumulative analysis. For each wetland, specify the following:

Directly abuts? (Y/N)	Size (in acres)	Directly abuts? (Y/N)	Size (in acres)
Y	0.653	Ν	0.148
Y	1.083	Y	1.068
Y	0.029		

Summarize overall biological, chemical and physical functions being performed: The wetland complex is comprised of five wetlands, which are located within the watershed of the jurisdictional determination area and adjacent/abutting the intermittent stream within the proposed project area, within the catchment. The wetland provides habitat for wildlife within the riparian corridor of the subject stream. It also provides limited flood storage; and, limited runoff control.

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the *Rapanos* Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below:

- 1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to Section III.D:
- 2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:
- 3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D: The subject tributary provides storage and filtration during precipitation events. It has been determined that the tributary possesses a hydrologic connectivity to the Verdigris River (Traditional Navigable Water) into which it indirectly flows. Hydrologic connectivity refers to the flow that transports organic matter and nutrients, energy, and aquatic organisms throughout the system (Freeman et al. 2006). Evidence of this connection and, consequently, a significant nexus is supported by observations and scientific literature. Solid OM, such as leaves and other detrital material, is processed by a feeding group referred to as "shredders", which includes crayfish, larvae of craneflies, caddisflies, and nymphs of stoneflies. Shredders break down this coarse material, and allow the material to be utilized by a secondary group known as "collectors". Collectors further process the OM and produce dissolved OM and fine particulate matter, which flow downstream. Generally, as the solid OM identified on the subject property is processed and translocated downstream, so are the microorganisms and invertebrates which utilize the material (Smith and Smith 2001). As such, headwater tributaries represent the base of the food chain and, therefore, comprise one of the most important components of a watershed (Meyer et al. 2007). That is, the diversity of aquatic fauna in this headwater stream contributes to the biodiversity of the Verdigris River by fitting into the complex foodweb of the river basin. Furthermore, the frequency of major rainfall events in the watershed results in pulsating hydrology, which sustains the local waterways, and subsequently, the Verdigris River system. This influences the chemistry of the Verdigris River basin via the transport of sediments and nutrients and geochemical cycling which occur during these pulses. Various pollutants are likely present since this stream is located in close proximity to a developed area. Typical pollutants, such as oil, become suspended in storm water and, without

adequate filtration, are transported downstream. After water is conveyed through the tributary, drying occurs in the headwater stream. This process of drying produces natural chemical and physical changes in the headwater stream. According to Izbicki (2007), even while headwater streams are drying, they remain an integral part of the overall stream because of this influence on the chemistry of the river downstream. Finally, headwater streams, such as the subject tributary, have been documented as providing necessary habitat for birds, mammals, reptiles, and amphibian populations (Meyer 2007). The small catchment area of headwater streams results in some of the most diverse habitats within a lotic system. Since the channel is greatly affected by precipitation events, the physical and chemical state of the stream changes rapidly and frequently which allows the habitat to be utilized a large variety of species. Headwater streams are utilized not only by species which are unique to headwater streams, but also by animals which depend on such an environment for certain stages of their life cycles and those which migrate between headwater environments and larger waters. Wetlands have been documented as having the capability of providing a longterm sink for nutrients present within waste, pesticides and fertilizers, primarily through their biogeochemical cycling (Walbridge and Lockaby 1994. Axt and Walbridge 1999). Due to this function, wetlands have long been termed the "kidneys of the landscape", due to their capacity to assist with pollutant filtration (Mitsch and Gosselink 2000). The linear portion of PEM1-1 centrally located within the review area does not exhibit a hydrologic connection to RPW1-1, a jurisdictional stream channel located on the property. This portion of PEM1-1 is located relatively close to the jurisdictional RPW and would be considered a neighbording wetland. The linear feature of the collectively identified PEM1-1 feature functions as a sediment and pollutant trap, in addition to providing habitat to aquatic organisms. This linear wetland functions in conjuction with other wetlands located within the review area to improve the chemical and physical integrity of downstream waters and the receiving TNW. Thus, the linear portion of PEM1-1 located within the review area has been determined to have a significant nexus to the downstream TNW. Because of the wetland's fluctuating hydrologic conditions, it likely hosts a variety of organisms dependent upon this type of system. Given that the wetland is located in close proximity to a developed area, it likely provides habitat for a variety of species also adapted to this type area. The wetland has the capacity to affect the conditions of the unnamed tributary through its ability to store storm water in times of heavy rain events and its habitat contributions. By reducing the volume and velocity of storm water entering the unnamed tributary, the wetland minimizes the erosive forces of the storm water. By reducing the volume and velocity of flow, erosion potentials decrease and sediment transport downstream becomes minimized. This affects the Verdigris River by reducing sediment input within these waters. The subject tributary possess a hydrologic connection to the Verdigris River through an open and defined channel. Due to this hydrologic connection, the subject tributary has the capacity to contribute hydrology, carry pollutants, provide habitat for aquatic life cycles, and provide food in the form of organic matter to waters downstream, all of which illustrates that the subject tributary and its associated wetlands possess a significant nexus to the Verdigris River LITERATURE CITED:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY):

TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
 TNWs: linear feet width (ft), Or, acres.
 Wetlands adjacent to TNWs: acres.

2. <u>RPWs that flow directly or indirectly into TNWs.</u>

- Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial:
- Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally: The unnamed tributary to Mossy Creek is identified on the USGS 7.5 Minute Sageeyah, Oklahoma Quadrangle as an intermittent stream channel. RPW1-1 exhibits wet conditions in 4 of 5 aerial images ranging from October 2018 to November of 2020. RPW1-1 exhibited flow during the environmental consultants field visit in July of 2021.

Provide estimates for jurisdictional waters in the review area (check all that apply):

Tributary waters: **1,191** linear feet **6.5**width (ft).

Other non-wetland waters: **0.358** acres.

Identify type(s) of waters: PUB-1 is a jurisdictional impoundment of Waters of the U.S.

3. Non-RPWs⁸ that flow directly or indirectly into TNWs.

Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has a significant nexus with a TNW is jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional waters within the review area (check all that apply):

acres.

- Tributary waters: linear feet width (ft).
- Other non-wetland waters:

Identify type(s) of waters:

4. Wetlands directly abutting an RPW that flow directly or indirectly into TNWs.

Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.

- Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW:
- Ketlands directly abutting an RPW where tributaries typically flow "seasonally." Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW: PEM1-2, PEM1-3, PEM1-4, and PFO1-1 identified within the review make up a linear wetland complex that includes PUB-1. This wetland complex directly abuts and contributes direct flow to RPW1-1 downstream, within the project review area. Through RPW1-1, these features contribute flow downstream to the Verdigris River, a TNW.

Provide acreage estimates for jurisdictional wetlands in the review area: 2.83 acres.

- 5. Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNWs.
 - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisidictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetlands in the review area: 0.148 acres.

6. Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs.

Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetlands in the review area: acres.

7. Impoundments of jurisdictional waters.⁹

As a general rule, the impoundment of a jurisdictional tributary remains jurisdictional.

- Demonstrate that impoundment was created from "waters of the U.S.," or
 - Demonstrate that water meets the criteria for one of the categories presented above (1-6), or
- Demonstrate that water is isolated with a nexus to commerce (see E below).

E. ISOLATED [INTERSTATE OR INTRA-STATE] WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE, INCLUDING ANY SUCH WATERS (CHECK ALL THAT APPLY):¹⁰

which are or could be used by interstate or foreign travelers for recreational or other purposes.

- from which fish or shellfish are or could be taken and sold in interstate or foreign commerce.
- which are or could be used for industrial purposes by industries in interstate commerce.
- Interstate isolated waters. Explain:
- Other factors. Explain:

Identify water body and summarize rationale supporting determination:

⁸See Footnote # 3.

⁹ To complete the analysis refer to the key in Section III.D.6 of the Instructional Guidebook.

¹⁰ Prior to asserting or declining CWA jurisdiction based solely on this category, Corps Districts will elevate the action to Corps and EPA HQ for review consistent with the process described in the Corps/EPA *Memorandum Regarding CWA Act Jurisdiction Following Rapanos*.

Provide estimates for jurisdictional waters in the review area (check all that apply):

Tributary waters: linear feet width (ft).

Other non-wetland waters: acres.

Identify type(s) of waters: .

Wetlands: acres.

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS (CHECK ALL THAT APPLY):

If potential wetlands were assessed within the review area, these areas did not meet the criteria in the 1987 Corps of Engineers Wetland Delineation Manual and/or appropriate Regional Supplements.

Review area included isolated waters with no substantial nexus to interstate (or foreign) commerce.

Prior to the Jan 2001 Supreme Court decision in "SWANCC," the review area would have been regulated based <u>solely</u> on the "Migratory Bird Rule" (MBR).

Н

Waters do not meet the "Significant Nexus" standard, where such a finding is required for jurisdiction. Explain:

Other: (explain, if not covered above):

Provide acreage estimates for non-jurisdictional waters in the review area, where the <u>sole</u> potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

Non-wetland waters (i.e., rivers, streams): linear feet width (ft). Lakes/ponds: acres.

Lakes/ponds: ac: Other non-wetland way

Other non-wetland waters: acres. List type of aquatic resource:

Wetlands: 0.15 acres.

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the "Significant Nexus" standard, where such a finding is required for jurisdiction (check all that apply):

Non-wetland waters (i.e., rivers, streams): linear feet, width (ft).

Lakes/ponds: acres.

Other non-wetland waters: acres. List type of aquatic resource:

Wetlands: acres.

SECTION IV: DATA SOURCES.

A.	SUP	PORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked
